the authors introduce the concept of finitely coloured equivalence for unital homomorphisms between algebras for

which unitary equivalence is the coloured case they use this notion to classify homomorphisms from separable unital nuclear algebras into ultrapowers of simple unital nuclear stable algebras with compact extremal trace space up to coloured equivalence by their behaviour on traces this is based on a coloured classification theorem for certain order zero maps also in terms of tracial data as an application the authors calculate the nuclear dimension of non af simple separable unital nuclear stable algebras with compact extremal trace space it is 1 in the case that the extremal trace space also has finite topological covering dimension this confirms the remaining open implication of the toms winter conjecture inspired by homotopy rigidity theorems in geometry and topology the authors derive a homotopy equivalence implies isomorphism result for large classes of algebras with finite nuclear dimension

this book presents new and original research in statistical information theory based on minimum divergence estimators and test statistics from a theoretical and applied point of view for different statistical problems with special emphasis on efficiency and robustness divergence statistics based on maximum likelihood estimators as well as wald s statistics likelihood ratio statistics and rao s score statistics share several optimum asymptotic properties but are highly non robust in cases of model misspecification under the presence of outlying observations it is well known that a small deviation from the underlying assumptions on the model can have drastic effect on the performance of these classical tests specifically this book presents a robust version of the classical wald statistical test for testing simple and composite null hypotheses for general parametric models based on minimum divergence estimators

fixed point theory is a powerful tool in nonlinear analysis with applications in fractional differential equations and other areas the most prominent application conclusion of this theory is the banach contraction principal the notion of invisible graphs introduced here for the first time will find applications in different areas of science the book examines the classical techniques of this theory with a critical approach along with the emergence of various generalizations in its evolution using the latest theories of the philosophy of science the author aims to provide a philosophical explanation for the gaps in the fixed point theory and introduce the reader to profound mathematical philosophical challenges

sharkovsky s theorem li and yorke s period three implies chaos result and the 3x 1 conjecture are beautiful and deep results that demonstrate the rich periodic character of first order nonlinear difference equations to date however we still know surprisingly little about higher order nonlinear difference equations during the last ten years the authors of this book have been fascinated with discovering periodicities in equations of higher order which for certain values of their parameters have one of the following characteristics 1 every solution of the equation is periodic with the same period 2 every solution of the equation is eventually periodic with a prescribed period 3 every solution of the equation converges to a periodic solution with the same period this monograph presents their findings along with some thought provoking questions and many open problems and conjectures worthy of investigation the authors also propose investigation of the global character of solutions of these equations for other values of their parameters and working toward a more complete picture of the global behavior of their solutions with the results and discussions it presents periodicities in nonlinear difference equations places a few more stones in the foundation of the basic theory of nonlinear difference equations researchers and graduate students working in difference equations and discrete dynamical systems will find much to intrigue them and inspire further work in this area

this festschrift volume contains papers presented at a conference prakash fest held in honor of prakash panangaden in oxford uk in may 2014 to celebrate his 60th birthday prakash panangaden has worked on a large variety of topics including probabilistic and concurrent computation logics and duality and quantum information and computation despite the enormous breadth of his research he has made significant and deep contributions for example he introduced logic and a real valued interpretation of the logic to capture equivalence of probabilistic processes quantitatively the 25 papers included in this volume were carefully reviewed they cover a large variety of topics in theoretical computer science

this book aims to highlight the latest developments in fixed point theory and functional analysis by presenting insights from renowned scientists physicists and mathematicians worldwide the book offers a comprehensive overview of the latest advancements in the field featuring original contributions and surveys readers will find a wealth of useful tools and techniques to deepen their understanding of recent advances in mathematical and functional analysis as well as

their applications in physics and engineering each chapter highlights new research avenues making this book an ideal resource for graduate students faculty and researchers seeking to expand their knowledge of fixed point theory and functional analysis as well as their practical applications the computational aspects in banach and hilbert spaces are well explored only a basic knowledge of analysis topology basic computation and functional analysis is required to fully appreciate the material
